# A POSTERIORI ERROR ESTIMATES OF A NON-CONFORMING FINITE ELEMENT METHOD FOR PROBLEMS WITH ARTIFICIAL BOUNDARY CONDITIONS 

XIANMIN XU AND ZHIPING LI ${ }^{\dagger}$<br>LMAM \& SCHOOL OF MATHEMATICAL SCIENCES,<br>PEKING UNIVERSITY, BEIJING 100871, P.R.CHINA

#### Abstract

An a posteriori error estimator is obtained for a nonconforming finite element approximation of a linear elliptic problem, which is derived from a corresponding unbounded domain problem by applying a nonlocal approximate artificial boundary condition. Our method can be easily extended to obtain a class of a posteriori error estimators for various conforming and nonconforming finite element approximations of problems with different artificial boundary conditions. The reliability and efficiency of our a posteriori error estimator is rigorously proved and is verified by numerical examples.

## 1. Introduction

Many physical and engineering problems such as, e.g. the electric field and the magnetic field, can be modelled by PDEs on unbounded domains. To efficiently solve such problems by numerical methods, one often introduces proper artificial boundary conditions to translate these problems to bounded domain ones [9, 10]. These artificial boundary conditions often have implicit integral forms, which are quite different from those of explicit boundary conditions: Dirichlet, Neaumann, or mixed boundary conditions.

Furthermore, when the solutions of the reduced bounded domain problems have some singularities such as, e.g. singularities arising from re-entrant corners, singularity of Green's function, adaptive mesh refinement strategy can be very useful to improve the efficiency of the finite element approximations, and a posteriori estimators are often required to identify the regions which need further

[^0]refinement. There are many different methods of the a posteriori estimation, e.g. the residual estimates [4, 12], the averaging methods [12, 14, 15], etc., however, they are mostly developed for bounded domain problems imposed with explicit boundary conditions.

In this paper, we will develop, for the first time to our knowledge, a reliable and efficient a posteriori estimator for a non-conforming finite element approximation of bounded domain elliptic problems with (at least part of) the boundary conditions given in an implicit integral form. Such problems come naturally from unbounded domain elliptic problems by imposing proper implicit artificial boundary conditions. For simplicity, we consider only a model exterior problem in two dimensions. Our approach, however, also easily applies to more general problems defined on unbounded domains, such as problems of the potential of the stray field energy in micromagnetics $[11,13]$ and the semi-strip field of stationary flow in a channel [10], etc..

The rest of the paper is organized as follows. In section 2 , we illustrate how to apply an artificial boundary method to a unbounded domain model problem to produce an equivalent bounded domain problem with an implicit artificial boundary condition $[9,10,11]$. In section 3 , inspired by [4], we introduce an equivalent mixed problem, which serves as a useful tool for the a posteriori error estimation. In section 4, a non-conforming finite element method for the reduced bounded domain problem is briefly discussed. In section 5, an a posteriori error estimator for the non-conforming finite element approximation of the model problem is given, and its reliability and efficiency are proved. In section 6 , some numerical examples are given to verify our analytical results.

## 2. The Model Problem and the Artificial Boundary Method

We consider a general second-order linear elliptic problem[10]

$$
\begin{align*}
-\operatorname{div}(A \nabla u)+c u & =f, & & \text { in } \Omega,  \tag{2.1}\\
(A \nabla u) \cdot \mathbf{n} & =g, & & \text { on } \Gamma_{N},  \tag{2.2}\\
u & =u_{D}, & & \text { on } \Gamma_{D},  \tag{2.3}\\
u-u_{\infty} & \rightarrow 0, & & \text { as }\|x\| \rightarrow \infty, \tag{2.4}
\end{align*}
$$

where $\Omega \subset \mathbf{R}^{2}$ is a unbounded domain with a Lipschitz boundary $\Gamma=\Gamma_{D} \bigcup \Gamma_{N}$ satisfying that the Dirichlet boundary $\Gamma_{D}$ is closed, $\Gamma_{D} \bigcap \Gamma_{N}=\emptyset$ and the length
of the Dirichlet boundary $\left|\Gamma_{D}\right|>0$ whenever $\Gamma_{D} \neq \emptyset, \mathbf{n}$ is the unit exterior normal to $\Gamma_{N}, u_{\infty}$ is in general a unknown constant and $u_{\infty}=0$ when $\Gamma_{D}=\emptyset$, $c \in L^{\infty}(\Omega)$ is non-negative and satisfies $c(x) \geq c_{0} \geq 0$ for almost all $x \in \Omega$, and the coefficient matrix $A \in L^{\infty}\left(\Omega ; \mathbf{R}^{2 \times 2}\right)$ is symmetric and uniformly positive definite, that is, for some constants $0<\mu<M<\infty$, there holds

$$
\mu\|y\|^{2} \leq y \cdot A(x) y \leq M\|y\|^{2}, \quad \forall y \in \mathbf{R}^{2} \text { and for a.e. } x \in \Omega .
$$

Furthermore, we assume that $\operatorname{supp}(f), \operatorname{supp}(A-I)$, and $\operatorname{supp}\left(c-c_{0}\right)$ are compact, where $\operatorname{supp}(\cdot)$ denotes the support set of a given function, and $I$ is the identity matrix.

For such a problem, if $R$ is sufficiently large so that $\operatorname{supp}(f) \cup \operatorname{supp}(A-I) \cup$ $\operatorname{supp}\left(c-c_{0}\right) \cup \Gamma \subset B(0, R):=\{x:\|x\|<R\}$, then the circle $\Gamma_{e}:=\{x:\|x\|=R\}$ can be taken as an artificial boundary, which divides the unbounded domain $\Omega$ into two parts $\Omega_{i}:=\Omega \bigcap B(0, R)$ and $\Omega_{e}=\{x:\|x\|>R\}$. Artificial boundary conditions can be introduced on $\Gamma_{e}=\partial B(0, R)$. For simplicity and without loss of generality, we restrict ourselves to the case when $c_{0}=0$, similar artificial boundary conditions for the general case can be found in [10].

Figure 1. The artificial boundary

Since the solution $u$ to problem (2.1)-(2.4) is harmonic in $\Omega_{e}$, we have, for $r>R$,

$$
\begin{equation*}
u(r, \theta)=\frac{a_{0}}{2}+\sum_{n=1}^{\infty}\left(\frac{R}{r}\right)^{n}\left(a_{n} \cos n \theta+b_{n} \sin n \theta\right) \tag{2.5}
\end{equation*}
$$

where

$$
\begin{equation*}
a_{n}=\frac{1}{\pi} \int_{0}^{2 \pi} u(R, \phi) \cos n \phi d \phi, \quad b_{n}=\frac{1}{\pi} \int_{0}^{2 \pi} u(R, \phi) \sin n \phi d \phi, \tag{2.6}
\end{equation*}
$$

are the Fourier coefficients of $u(R, \theta)$, and we have $u_{\infty}=a_{0} / 2$.
Differentiate (2.5) with respect to $r$ and set $r=R$, we obtain

$$
\begin{equation*}
\frac{\partial u(R, \theta)}{\partial r}=-\frac{1}{\pi R} \sum_{n=1}^{\infty} n \int_{0}^{2 \pi} u(R, \phi) \cos n(\theta-\phi) d \phi \equiv \mathcal{B} u(R, \theta) . \tag{2.7}
\end{equation*}
$$

where $\mathcal{B}: H^{1 / 2}\left(\Gamma_{e}\right) \rightarrow H^{-1 / 2}\left(\Gamma_{e}\right)$ is a bounded operator [7]. Let $\mathbf{n}$ be the unit exterior normal to $\Gamma_{e}$ with respect to $\Omega_{i}$, then by (2.7) and the fact that $u$ is harmonic in a neighborhood of $\Gamma_{e}$, we obtain an artificial boundary condition

$$
\begin{equation*}
\frac{\partial u(R, \phi)}{\partial \mathbf{n}}=\mathcal{B} u(R, \phi) \tag{2.8}
\end{equation*}
$$

Thus, the unbounded domain problem (2.1)-(2.4) is reduced to the following equivalent problem defined on the bounded domain $\Omega_{i}$

$$
\begin{align*}
-\operatorname{div}(A \nabla u)+c u & =f, & & \text { in } \Omega_{i},  \tag{2.9}\\
(A \nabla u) \cdot \mathbf{n} & =g, & & \text { on } \Gamma_{N},  \tag{2.10}\\
u & =u_{D}, & & \text { on } \Gamma_{D},  \tag{2.11}\\
\frac{\partial u(R, \theta)}{\partial \mathbf{n}} & =\mathcal{B} u(R, \theta), & & \text { on } \Gamma_{e}, \tag{2.12}
\end{align*}
$$

which has, other than the usual Dirichlet and Neumann boundary conditions, an implicit artificial boundary condition in differential-integral form (2.12). In addition, in the particular case when $\Gamma_{D}=\emptyset$, the Dirichlet boundary condition (2.11) must be replaced by the following integral boundary condition

$$
\begin{equation*}
\int_{0}^{2 \pi} u(R, \theta) d \theta=0 \tag{2.13}
\end{equation*}
$$

Let

$$
\begin{aligned}
& V= \begin{cases}\left\{v \in H^{1}\left(\Omega_{i}\right) \mid \int_{0}^{2 \pi} u(R, \theta) d \theta=0\right\}, & \text { if } \Gamma_{D}=\emptyset \\
\left\{v \in H^{1}\left(\Omega_{i}\right) \mid v=u_{D} \text { on } \Gamma_{D}\right\}, & \text { otherwise }\end{cases} \\
& V_{0}= \begin{cases}\left\{v \in H^{1}\left(\Omega_{i}\right) \mid \int_{0}^{2 \pi} u(R, \theta) d \theta=0\right\}, & \text { if } \Gamma_{D}=\emptyset \\
\left\{v \in H^{1}\left(\Omega_{i}\right) \mid v=0, \text { on } \Gamma_{D}\right\}, & \text { otherwise }\end{cases}
\end{aligned}
$$

The only difference of above two definitions is the boundary condition on $\Gamma_{D}$. Suppose that $g \in L^{2}\left(\Gamma_{N}\right), u_{D} \in H^{1 / 2}\left(\Gamma_{D}\right)$, and suppose that $f \in H^{-1}(\Omega)$ instead of $L^{2}(\Omega)$ so that we can cover more practical problems, for example, the problem of the stray field energy potential in micromagnetics (see Section 6). Without loss of generality, we may assume that, for some $f_{0}, f_{1}, f_{2} \in L^{2}\left(\Omega_{i}\right)$, (see [1])

$$
\begin{equation*}
<v, f>=\int_{\Omega_{i}} f_{0}(x) v(x)+f_{1}(x) \partial_{1} v+f_{2}(x) \partial_{2} v(x) d x, \quad \forall v \in V_{0} \tag{2.14}
\end{equation*}
$$

where $f$ is regarded as an element in the dual space $V_{0}^{*}$.
Then, problem (2.9)-(2.12) has the following weak formulation

$$
\left\{\begin{array}{l}
\text { Find } u \in V \text { such that }  \tag{2.15}\\
a(u, v)+b(u, v)=f(v), \quad \forall v \in V_{0}
\end{array}\right.
$$

where

$$
\begin{align*}
a(u, v) & =\int_{\Omega_{i}} A \nabla u \cdot \nabla v d x+\int_{\Omega_{i}} c u v d x  \tag{2.16}\\
b(u, v) & =\sum_{n=1}^{\infty} \frac{n}{\pi} \int_{0}^{2 \pi} \int_{0}^{2 \pi} \cos n(\theta-\phi) u(R, \theta) v(R, \phi) d \theta d \phi  \tag{2.17}\\
f(v) & =\int_{\Omega_{i}} f_{0}(x) v(x)+f_{1}(x) \partial_{1} v+f_{2}(x) \partial_{2} v(x) d x+\int_{\Gamma_{N}} g v d s . \tag{2.18}
\end{align*}
$$

In numerical computations, the infinite summation in the exact artificial boundary condition (2.12) needs to be truncated. This leads to a series of approximate artificial boundary conditions

$$
\begin{equation*}
\frac{\partial u}{\partial \mathbf{n}}=\mathcal{B}_{N} u \equiv-\frac{1}{\pi R} \sum_{n=1}^{N} n \int_{0}^{2 \pi} u(R, \phi) \cos n(\theta-\phi) d \phi, \quad N=1,2, \ldots, \tag{2.19}
\end{equation*}
$$

and the corresponding variational problems

$$
\left\{\begin{array}{l}
\text { Find } u \in V \text { such that }  \tag{2.20}\\
a(u, v)+b_{N}(u, v)=f(v), \quad \forall v \in V_{0}
\end{array}\right.
$$

where $b_{N}(u, v)$ is given by

$$
\begin{equation*}
b_{N}(u, v)=\sum_{n=1}^{N} \frac{n}{\pi} \int_{0}^{2 \pi} \int_{0}^{2 \pi} \cos n(\theta-\phi) u(R, \theta) v(R, \phi) d \theta d \phi \tag{2.21}
\end{equation*}
$$

It is well known that the symmetric bilinear forms $b_{N}(\cdot, \cdot)$ are uniformly bounded in $H^{1}\left(\Omega_{i}\right) \times H^{1}\left(\Omega_{i}\right)$, i.e. there exists a positive constant $C$, such that

$$
\begin{equation*}
\left|b_{N}(u, v)\right| \leq C\|u\|_{1, \Omega_{i}}\|v\|_{1, \Omega_{i}}, \quad \forall u, v \in H^{1}\left(\Omega_{i}\right) \text { and } \forall N, \tag{2.22}
\end{equation*}
$$

furthermore, the bilinear forms $a(u, v)+b(u, v)$ and $a(u, v)+b_{N}(u, v)$ are symmetric, uniformly bounded and $V_{0}$-elliptic, and we have the following existence theorem(see [9] and [10]):

Theorem 2.1. Problem (2.15) has a unique solution. For each N, problem (2.20) has a unique solution.

Furthermore, we have the following convergence theorem whose proof could be given from Lemma 4.1 in [10].

Theorem 2.2. Let $u, u_{N} \in H^{1}\left(\Omega_{i}\right)$ be the solutions of (2.15) and (2.20) respectively. Suppose there exist $R_{0}<R$ and an integer $k \geq 1$ such that $\Gamma \subset B\left(0, R_{0}\right)$ and $\left.u\right|_{\partial B\left(0, R_{0}\right)} \in H^{k-\frac{1}{2}}\left(\partial B\left(0, R_{0}\right)\right)$. Then, we have

$$
\begin{equation*}
\left|u-u_{N}\right|_{1, \Omega_{i}} \leq \frac{C}{(N+1)^{k+1}}\left(\frac{R_{0}}{R}\right)^{N+1}|u|_{k-\frac{1}{2}, \partial B\left(0, R_{0}\right)} \tag{2.23}
\end{equation*}
$$

where $C$ is a constant independent of $k, R_{0}$ and $N$.
Remark 2.1. In applications, we can always choose $R$ and $R_{0}$ so that $u$ is sufficiently smooth near $\partial B\left(0, R_{0}\right)$. Hence, the inequality (2.23) indicates that a small $N$ would usually be sufficient to achieve a good approximation.

## 3. The Equivalent Mixed Problem

With the method developed in [6] (Section7.1. page 383-386), we establish a mixed problem equivalent to problem (2.20) as follows (see also [4])

$$
\begin{cases}\text { Find }(p, u) \in L \times V, \text { such that }  \tag{3.1}\\ \alpha(p, q)-\beta(q, u)=0, & \forall q \in L, \\ \beta(p, v)+\gamma(u, v)=f(v), & \forall v \in V_{0},\end{cases}
$$

where $L \equiv\left(L^{2}\left(\Omega_{i}\right)\right)^{2}$ and

$$
\begin{align*}
\alpha(p, q) & =\int_{\Omega_{i}} A p \cdot q d x  \tag{3.2}\\
\beta(q, u) & =\int_{\Omega_{i}} A q \cdot \nabla u d x  \tag{3.3}\\
\gamma(u, v) & =\int_{\Omega_{i}} c u v d x+b_{N}(u, v) . \tag{3.4}
\end{align*}
$$

Using a similar technique as is used in [4] for bounded domain problems with explicit boundary conditions, we establish the following theorem, which is useful in the a posteriori error estimation for the finite element approximations of problem (2.20).

Theorem 3.1. Let $\mathcal{A}: L \times V_{0} \rightarrow\left(L \times V_{0}\right)^{*}$ be an operator defined by $\mathcal{A}(p, u)(q, v)$ $:=\mathcal{A}_{1}(p, u)(q)+\mathcal{A}_{2}(p, u)(v)$ with

$$
\begin{aligned}
& \mathcal{A}_{1}(p, u)(q)=\alpha(p, q)-\beta(q, u) \\
& \mathcal{A}_{2}(p, u)(v)=\beta(p, v)+\gamma(u, v)
\end{aligned}
$$

Then, $\mathcal{A}$ is both surjective and injective, and we have

$$
\begin{equation*}
C^{\prime}\left(\|p\|_{0}+\|u\|_{1}\right) \leq\|\mathcal{A}(p, u)\|_{\left(L \times V_{0}\right)^{*}} \leq C\left(\|p\|_{0}+\|u\|_{1}\right), \quad \forall(p, u) \in L \times V_{0} \tag{3.5}
\end{equation*}
$$

where $0<C^{\prime} \leq C$ are constants independent of $p$ and $u$.
Proof. We only need to show (3.5). The second inequality follows as a direct consequence from the boundedness of the coefficients $A$ and $c$, and the uniform boundedness of $b_{N}$ (see (2.22)). The first inequality is equivalent to the following inf-sup condition:

$$
\begin{equation*}
\inf _{y \in L \times V_{0}} \sup _{z \in L \times V_{0}} \frac{(\mathcal{A} y, z)}{\|y\|\|z\|} \geq C^{\prime} \tag{3.6}
\end{equation*}
$$

In fact, for any $y=(p, u) \in L \times V_{0}$, let $z=(q, v)=(p-\nabla u, 2 u) \in L \times V_{0}$, then, it follows from the uniform $V_{0}$-ellipticity of $a(u, v)+b_{N}(u, v)$ and the uniform positive definiteness of the coefficient matrix $A$ that there exists a constant $C^{\prime}>0$ such that

$$
\begin{aligned}
\mathcal{A}(p, u)(q, v) & =\alpha(p, q)-\beta(q, u)+\beta(p, v)+\gamma(u, v) \\
& =\alpha(p, p)+\beta(\nabla u, u)+2 \gamma(u, u) \\
& \geq 6 C^{\prime}\left(\|p\|_{0, \Omega_{i}}^{2}+\|u\|_{1, \Omega_{i}}^{2}\right) \\
& \geq C^{\prime}\left(\|p\|_{0, \Omega_{i}}+\|u\|_{1, \Omega_{i}}\right)\left(\|p\|_{0, \Omega_{i}}+3\|u\|_{1, \Omega_{i}}\right) \\
& \geq C^{\prime}\left(\|p\|_{0, \Omega_{i}}+\|u\|_{1, \Omega_{i}}\right)\left(\|q\|_{0, \Omega_{i}}+\|v\|_{1, \Omega_{i}}\right) .
\end{aligned}
$$

This yields (3.6) and completes the proof.

## 4. The finite element discretization

Let $\mathcal{T}_{h}=\{K\}$ be a family of regular triangulations of $\Omega_{i}$ satisfying

$$
\begin{equation*}
\left|a_{i j}-b_{i j}\right| \leq C h_{K}^{2}, \quad \forall K \text { on } \Gamma_{e}, \tag{4.1}
\end{equation*}
$$

for some constant $C$, where $a_{i j}$ is the midpoint of the arc $\widehat{a_{i} a_{j}}$, and $b_{i j}$ is the midpoint of the section $\overline{a_{i} a_{j}}$ (Figure 2), and $h_{K}$ is the diameter of element $K$, which guarantees that the geometric non-conforming error is of higher order (Section 4.3 in [6]).

Figure 2. The element near $\Gamma_{e}$

We use Crouzeix-Raviart element to construct the finite element spaces,

$$
U_{h}=\left\{\left.v\right|_{K} \in P_{1}(K), \forall K \in \mathcal{T}_{h}: v \text { is continuous on } \mathcal{M}_{h}\right\}
$$

where $\mathcal{M}_{h}=\left\{\right.$ the midpoints of the edges in $\left.\mathcal{T}_{h}\right\}$, and

$$
\begin{gathered}
V_{h}= \begin{cases}\left\{v \in U_{h}: \int_{\Gamma_{e}} v d x=0\right\}, & \text { if } \Gamma_{D}=\emptyset, \\
\left\{v \in U_{h}: v\left(a_{i j}\right)=\frac{1}{|E|} \int_{E} u_{D} d s, \text { if } a_{i j} \in \mathcal{M}_{h} \bigcap E, E \subset \Gamma_{D}\right\}, & \text { otherwise } ;\end{cases} \\
V_{h, 0}= \begin{cases}\left\{v \in U_{h}: \int_{\Gamma_{e}} v d x=0\right\}, & \text { if } \Gamma_{D}=\emptyset \\
\left\{v \in U_{h}: v\left(a_{i j}\right)=0, \text { if } a_{i j} \in \mathcal{M}_{h} \bigcap \Gamma_{D}\right\}, & \text { otherwise }\end{cases}
\end{gathered}
$$

We consider the following finite element problem for (2.20)

$$
\left\{\begin{array}{l}
\text { Find } u_{h} \in V_{h} \text { such that }  \tag{4.2}\\
a_{h}\left(u_{h}, v_{h}\right)+b_{N}\left(u_{h}, v_{h}\right)=f_{h}\left(v_{h}\right), \quad \forall v_{h} \in V_{h, 0}
\end{array}\right.
$$

where

$$
\begin{align*}
a_{h}\left(u_{h}, v_{h}\right)= & \sum_{K \in \mathcal{T}_{h}}\left\{\int_{K} A \nabla u_{h} \cdot \nabla v_{h} d x+\int_{K} c u_{h} v_{h} d x\right\},  \tag{4.3}\\
b_{N}\left(u_{h}, v_{h}\right)= & \sum_{n=1}^{N} \frac{n}{\pi} \int_{0}^{2 \pi} \int_{0}^{2 \pi} \cos n(\theta-\phi) u_{h}(R, \theta) v_{h}(R, \phi) d \phi d \theta \\
= & \sum_{n=1}^{N} \frac{n}{\pi}\left(\int_{0}^{2 \pi} u_{h}(R, \theta) \cos n \theta d \theta \int_{0}^{2 \pi} v_{h}(R, \phi) \cos n \phi d \phi\right. \\
& \left.+\int_{0}^{2 \pi} u_{h}(R, \theta) \sin n \theta d \theta \int_{0}^{2 \pi} v_{h}(R, \phi) \sin n \phi d \phi\right),  \tag{4.4}\\
f_{h}\left(v_{h}\right)= & \sum_{K \in \mathcal{T}_{h}}\left\{\int_{K} f_{0} v_{h}+f_{1} \partial_{1} v_{h}+f_{2} \partial_{2} v_{h} d x\right\}+\int_{\Gamma_{N}} g v_{h} d s . \tag{4.5}
\end{align*}
$$

In the computation of (4.4), the integrals are calculated by numerical quadrature formulas. For example, by trapezoidal rule we get

$$
\int_{0}^{2 \pi} u_{h}(R, \theta) \cos n \theta d \theta \doteq \sum_{\widehat{a_{i} a_{j}} \subset \Gamma_{e}}\left|\theta_{i}-\theta_{j}\right| \frac{\left.u_{h}\right|_{\overline{a_{i} a_{j}}}\left(a_{i}\right) \cos \left(n \theta_{i}\right)+\left.u_{h}\right|_{\overline{i_{i} a_{j}}}\left(a_{j}\right) \cos \left(n \theta_{j}\right)}{2},
$$

where $\theta_{i}$ and $\theta_{j}$ are the polar angles corresponding to $a_{i}$ and $a_{j}$, respectively. Notice that the error introduced by numerical quadrature is of higher order, for simplicity, we would ignore its effect in the following analysis.

Similar to that for problem (2.20), we have
Theorem 4.1. The finite element problem (4.2) has a unique solution.
The following theorem is important for our a posteriori estimation.
Theorem 4.2. Let $(p, u)$ be the solution of the mixed problem (3.1). Then, for any $p_{h} \in L_{h}:=\left\{p_{h}:\left.p_{h}\right|_{K}=\left.\nabla v_{h}\right|_{K}, \forall K \in \mathcal{T}_{h}\right.$, for some $\left.v_{h} \in V_{h}\right\}$ and $\tilde{u}_{h} \in V$, we have

$$
\begin{equation*}
\left\|p-p_{h}\right\|_{0, \Omega_{i}}+\left\|u-\tilde{u}_{h}\right\|_{1, \Omega_{i}} \leq C\left(\left\|\operatorname{Res}_{L}\left(p_{h}, \tilde{u}_{h}\right)\right\|_{L^{*}}+\left\|\operatorname{Res}_{V}\left(p_{h}, \tilde{u}_{h}\right)\right\|_{V_{0}^{*}}\right) \tag{4.6}
\end{equation*}
$$

where $\operatorname{Res}_{L}\left(p_{h}, \tilde{u}_{h}\right) \in L^{*}$ and $\operatorname{Res}_{V}\left(p_{h}, \tilde{u}_{h}\right) \in V_{0}^{*}$ are defined by

$$
\begin{align*}
& \operatorname{Res}_{L}\left(p_{h}, \tilde{u}_{h}\right)(q):=\alpha\left(p_{h}, q\right)-\beta\left(q, \tilde{u}_{h}\right)  \tag{4.7}\\
& \operatorname{Res}_{V}\left(p_{h}, \tilde{u}_{h}\right)(v):=-f(v)+\beta\left(p_{h}, v\right)+\gamma\left(\tilde{u}_{h}, v\right) \tag{4.8}
\end{align*}
$$

Proof. It is easy to verify that

$$
\begin{aligned}
& \operatorname{Res}_{L}\left(p_{h}, \tilde{u}_{h}\right)(q)=-\left(\alpha\left(p-p_{h}, q\right)-\beta\left(q, u-\tilde{u}_{h}\right)\right), \\
& \operatorname{Res}_{V}\left(p_{h}, \tilde{u}_{h}\right)(v)=-\left(\beta\left(p-p_{h}, v\right)+\gamma\left(u-\tilde{u}_{h}, v\right)\right) .
\end{aligned}
$$

Thus, the conclusion follows as a consequence of theorem 3.1.
In the last part of this section, we will introduce a lemma which is to estimate the error of the approximation for functions in $V_{h}$ by some functions in $V$. This lemma is useful for our a posteriori error estimation in next section. For simplicity of analysis and illustration, we suppose hereinafter that the boundary $\Gamma_{D} \cup \Gamma_{N}$ is piecewise linear. For general curve boundaries, we could use piecewise linear approximations to get sufficient accuracy ([6]).

We firstly introduce some definitions. Given any function $u_{h} \in V_{h}$, we could define a function $\tilde{u}_{h} \in V$ element-wisely in the following way:

$$
\left.\tilde{u}_{h}\right|_{K}= \begin{cases}\tilde{u}_{h}\left(a_{0}\right) \varphi_{0}(x)+u_{D}\left(x_{D}\right)\left(\varphi_{1}(x)+\varphi_{2}(x)\right) & \text { if some edge } \overline{a_{1} a_{2}} \subset \Gamma_{D},  \tag{4.9}\\ \sum_{i=0}^{2} \tilde{u}_{h}\left(a_{i}\right) \varphi_{i}(x), & \text { otherwise }\end{cases}
$$

where $K \in \mathcal{T}_{h}, a_{i}$ with $i=0,1,2$, are nodes of $K, \varphi_{i} \in P^{1}(K)$ such that $\varphi_{i}\left(a_{j}\right)=\delta_{i j}$ are the one-order finite element base functions on the triangle $K, x_{D}(x) \in \Gamma_{D}$ is the intersection of the line $a_{0} x$ and the interval $\overline{a_{1} a_{2}}$ (see Figure 3), and $\tilde{u}_{h}\left(a_{i}\right)$ is given as following

$$
\tilde{u}_{h}\left(a_{i}\right)= \begin{cases}u_{D}\left(a_{i}\right) & \text { if } a_{i} \in \Gamma_{D} \\ \left.\sum_{K^{\prime} \in \omega_{a_{i}}} \frac{\left|K^{\prime}\right|}{\left|\omega_{a_{i}}\right|} u_{h}\right|_{K^{\prime}}\left(a_{i}\right), & \text { otherwise }\end{cases}
$$

Here, we note $\omega_{a_{i}}=\cup_{\left\{K^{\prime} \in \mathcal{T}_{h}: a_{i} \in K^{\prime}\right\}} K^{\prime}$.

Figure 3. The element near $\Gamma_{D}$

The following lemma gives a local estimate for the approximation error $\left\|u_{h}-\tilde{u}_{h}\right\|$.
Lemma 4.1. Let $u_{h} \in V_{h}, \tilde{u}_{h} \in V$ is defined as above, denote $\mathcal{E}=\left\{\right.$ the edges in $\left.\mathcal{T}_{h}\right\}$. Then we have
$\left\|u_{h}-\tilde{u}_{h}\right\|_{i, K} \leq \begin{cases}C\left(\sum_{\substack{E \cap K \neq \emptyset \\ \mathcal{E} \ni E \not \subset \not \Omega_{i}}} h_{E}^{3-2 i}\left\|\left[\nabla u_{h} \cdot \mathbf{s}\right]\right\|_{0, E}^{2}\right)^{1 / 2}, & \text { if } K \cap \Gamma_{D}=\varnothing, \\ C\left(\sum_{\substack{E \cap K \neq \emptyset \\ \mathcal{E} \ni E \subset \Gamma_{D}}}\left(h_{E}^{3-2 i}\left\|\nabla u_{h} \cdot \mathbf{s}-\frac{\partial u_{D}}{\partial \mathbf{s}}\right\|_{0, E}^{2}+h_{E}^{5-2 i}\left\|\frac{\partial^{2} u_{D}}{\partial \mathbf{s}^{2}}\right\|_{0, E}^{2}\right)\right. & \\ & \left.+\sum_{\substack{E \cap K \neq \emptyset \\ \mathcal{E} \ni E \not \subset \partial \Omega_{i}}} h_{E}^{3-2 i}\left\|\left[\nabla u_{h} \cdot \mathbf{s}\right]\right\|_{0, E}^{2}\right)^{1 / 2}, \\ \text { otherwise, }\end{cases}$
for any $K \in \mathcal{T}_{h}$ and $i=0,1$, and

$$
\left\|u_{h}-\tilde{u}_{h}\right\|_{0, E} \leq\left\{\begin{array}{ll}
C\left(\sum_{\substack{E^{\prime} \cap E \neq \emptyset \\
\mathcal{E} \ni \nexists \not \supset \partial \Omega_{i}}} h_{E^{\prime}}^{2}\left\|\left[\nabla u_{h} \cdot \mathbf{s}\right]\right\|_{0, E^{\prime}}^{2}\right)^{1 / 2}, & \text { if } E \cap \Gamma_{D}=\emptyset, \\
C\left(\sum_{\substack{E^{\prime} \cap E \neq \emptyset \\
\mathcal{E} \ni E^{\prime} \subset \Gamma_{D}}}\left(h_{E^{\prime}}^{2}\left\|\nabla u_{h} \cdot \mathbf{s}-\frac{\partial u_{D}}{\partial \mathbf{s}}\right\|_{0, E^{\prime}}^{2}+h_{E^{\prime}}^{4}\left\|\frac{\partial^{2} u_{D}}{\partial \mathbf{s}^{2}}\right\|_{0, E^{\prime}}^{2}\right)\right. \\
& \left.+\sum_{\substack{E^{\prime} \cap E \neq \emptyset \\
\mathcal{E} \ni E^{\prime} \not \subset \partial \Omega_{i}}} h_{E^{\prime}}^{2}\left\|\left[\nabla u_{h} \cdot \mathbf{s}\right]\right\|_{0, E^{\prime}}^{2}\right)^{1 / 2},
\end{array}\right. \text { otherwise,}
$$

for any $E \in \mathcal{E}$, where $\mathbf{s}$ denotes the unit tangent vectors to corresponding edges, and [•] is the jump of a function on corresponding edges.

Proof. We only prove the first inequality with $i=1$ and when the element $K$ has one edge $\overline{a_{1} a_{2}}$ such that $\overline{a_{1} a_{2}} \subset \Gamma_{D}$. In this case, we would like to prove

$$
\begin{align*}
\left\|\nabla u_{h}-\nabla \tilde{u}_{h}\right\|_{0, K} \leq & C\left(h_{\overline{a_{1} a_{2}}}\left\|\nabla u_{h} \cdot \mathbf{s}-\frac{\partial u_{D}}{\partial \mathbf{s}}\right\|_{0, \overline{a_{1} a_{2}}}^{2}+h_{\overline{a_{1} a_{2}}}^{3}\left\|\frac{\partial^{2} u_{D}}{\partial \mathbf{s}^{2}}\right\|_{0, \overline{a_{1} a_{2}}}^{2}\right. \\
& \left.+\sum_{\mathcal{E} \ni E \ni a_{0}} h_{E}\left\|\left[\nabla u_{h} \cdot \mathbf{s}\right]\right\|_{0, E}^{2}\right)^{1 / 2} \tag{4.10}
\end{align*}
$$

where $a_{0}$ is another node of $K$. The proof of any other cases could be done in a similar way.

For such an element $K$, from the definition (4.9) of $\tilde{u}_{h}$ and also noticed that $u_{h}(x)$ could be rewritten as

$$
u_{h}(x)=u_{h}\left(a_{0}\right) \varphi(x)+u_{h}\left(x_{D}\right)\left(\varphi_{1}(x)+\varphi_{2}(x)\right)
$$

we have

$$
\begin{align*}
\int_{K}\left|\nabla u_{h}-\nabla \tilde{u}_{h}\right|^{2} d x \leq & 2\left\{\left(\left.u_{h}\right|_{K}\left(a_{0}\right)-\tilde{u}_{h}\left(a_{0}\right)\right)^{2} \int_{K}\left|\nabla \varphi_{0}\right|^{2} d x\right. \\
& +\int_{K}\left(u_{D}\left(x_{D}\right)-u_{h}\left(x_{D}\right)\right)^{2}\left|\nabla\left(\varphi_{1}(x)-\varphi_{2}(x)\right)\right|^{2} d x \\
& \left.+\int_{K}\left(\varphi_{1}(x)-\varphi_{2}(x)\right)^{2}\left|\nabla\left(u_{D}\left(x_{D}\right)-u_{h}\left(x_{D}\right)\right)\right|^{2} d x\right\} \\
= & 2\left(I_{1}+I_{2}+I_{3}\right) . \tag{4.11}
\end{align*}
$$

For $I_{1}$, we have

$$
I_{1} \leq C\left(\left.u_{h}\right|_{K}\left(a_{0}\right)-\tilde{u}_{h}\left(a_{0}\right)\right)^{2}
$$

$$
\begin{align*}
& \leq C\left(\left.u_{h}\right|_{K}\left(a_{0}\right)-\left.\sum_{K^{\prime} \in \omega_{a_{0}}} \frac{\left|K^{\prime}\right|}{\left|\omega_{a_{0}}\right|} u_{h}\right|_{K^{\prime}}\left(a_{0}\right)\right)^{2} \\
& =C\left(\sum_{K^{\prime} \in \omega_{a_{0}}} \frac{\left|K^{\prime}\right|}{\left|\omega_{a_{0}}\right|}\left(\left.u_{h}\right|_{K}\left(a_{0}\right)-\left.u_{h}\right|_{K^{\prime}}\left(a_{0}\right)\right)\right)^{2} \\
& \leq C\left(\sum_{\substack{K_{i}^{\prime}, K_{j}^{\prime} \in \omega_{a_{0}} \\
K_{i}^{\prime} \cap K_{j}^{\prime}=E \in \mathcal{E}}}\left|u_{h}\right|_{K_{i}^{\prime}}\left(a_{0}\right)-\left.u_{h}\right|_{K_{j}^{\prime}}\left(a_{0}\right) \mid\right)^{2} \\
& \leq C\left(\sum_{\mathcal{E} \ni E \ni a_{0}} \frac{1}{2}\left|\int_{E}\left[\nabla u_{h} \cdot \mathbf{s}\right] d s\right|\right)^{2} \\
& \leq C\left(\sum_{\mathcal{E} \ni E \ni a_{0}} h_{E} \int_{E}\left|\left[\nabla u_{h} \cdot \mathbf{s}\right]\right|^{2} d s\right) . \tag{4.12}
\end{align*}
$$

For $I_{2}$ and $I_{3}$, we let $\hat{K}=\left\{\hat{x} \in R^{2}: 0 \leq \hat{x}_{1}, \hat{x}_{2}, \hat{x}_{1}+\hat{x}_{2} \leq 1\right\}$ be the reference element, $\hat{a}_{0}=(1,0), \hat{a}_{1}=(0,1)$ and $\hat{a}_{2}=(0,0)$ be the nodes of $\hat{K}$, and $\hat{\varphi}_{i} \in P^{1}(\hat{K})$ such that $\hat{\varphi}_{i}\left(\hat{a}_{j}\right)=\delta_{i j}$ be the finite element base functions in $\hat{K}$. Then by classical scaling techniques in finite element analysis ([6]) and also by the definition of boundary conditions for the finite element space $V_{h}$, we get

$$
\begin{align*}
I_{2} & \leq C \int_{\hat{K}}\left|u_{D}\left(\hat{x}_{D}\right)-u_{h}\left(\hat{x}_{D}\right)\right|^{2}\left|\nabla_{\hat{x}}\left(\hat{\varphi}_{1}(\hat{x})-\hat{\varphi}_{2}(\hat{x})\right)\right|^{2} d \hat{x} \\
& \leq C \int_{\hat{K}}\left|u_{D}\left(\hat{x}_{D}\right)-u_{h}\left(\hat{x}_{D}\right)\right|^{2} d \hat{x} \\
& \leq C \int_{\hat{a}_{1} \hat{a}_{2}}\left|u_{D}(\hat{s})-u_{h}(\hat{s})\right|^{2} d \hat{s} \\
& \leq \frac{C}{h_{\overline{a_{1} a_{2}}}} \int_{\overline{a_{1} a_{2}}}\left|u_{D}(s)-u_{h}(s)\right|^{2} d s \\
& \leq C\left(h_{\overline{a_{1} a_{2}}} \int_{\overline{a_{1} a_{2}}}\left(\frac{\partial u_{D}}{\partial s}-\nabla u_{h} \cdot \mathbf{s}\right)^{2} d s+h_{\overline{a_{1} a_{2}}}^{3} \int_{\overline{a_{1} a_{2}}}\left(\frac{\partial^{2} u_{D}}{\partial s^{2}}\right)^{2} d s\right),( \tag{4.13}
\end{align*}
$$

and

$$
I_{3} \leq C \int_{\hat{K}}\left|\hat{\varphi}_{1}(\hat{x})-\hat{\varphi}_{2}(\hat{x})\right|^{2}\left|\nabla_{\hat{x}}\left(u_{D}\left(\hat{x}_{D}\right)-u_{h}\left(\hat{x}_{D}\right)\right)\right|^{2} d \hat{x}
$$

$$
\begin{align*}
& =C \int_{\hat{K}}\left|\hat{\varphi}_{1}(\hat{x})-\hat{\varphi}_{2}(\hat{x})\right|^{2}\left|\frac{\partial\left(u_{D}\left(\hat{x}_{D}\right)-u_{h}\left(\hat{x}_{D}\right)\right)}{\partial \hat{x}_{2}}\right|^{2}\left(1+\frac{\hat{x}_{2}^{2}}{\left(1-\hat{x}_{1}\right)^{2}}\right) d \hat{x} \\
& \leq C \int_{\hat{K}}\left|\hat{\varphi}_{1}(\hat{x})-\hat{\varphi}_{2}(\hat{x})\right|^{2}\left|\frac{\partial\left(u_{D}\left(\hat{x}_{D}\right)-u_{h}\left(\hat{x}_{D}\right)\right)}{\partial \hat{x}_{2}}\right|^{2} d \hat{x} \\
& \leq C \int_{\hat{a}_{1} \hat{a}_{2}}\left|\frac{\partial\left(u_{D}\left(\hat{x}_{D}\right)-u_{h}\left(\hat{x}_{D}\right)\right)}{\partial \hat{x}_{2}}\right|^{2} d \hat{x}_{2} \\
& =C \int_{\hat{a}_{1} \hat{a}_{2}}\left|\frac{\partial u_{D}}{\partial \hat{s}}-\nabla u_{h} \cdot \hat{\mathbf{s}}\right|^{2} d \hat{s} \\
& \leq C h_{\overline{a_{1} a_{2}}} \int_{\overline{a_{1} a_{2}}}\left|\frac{\partial u_{D}}{\partial s}-\nabla u_{h} \cdot \mathbf{s}\right|^{2} d s . \tag{4.14}
\end{align*}
$$

From inequality (4.11)-(4.14), we get (4.10).

## 5. The a Posteriori Estimator and Its Reliability and Efficiency

For $K \in \mathcal{T}_{h}$, let $\mathcal{E}_{K}=\left\{E \subset \mathbf{R}^{2}: E\right.$ is an edge of $\left.K\right\}$, and define

$$
\begin{align*}
& \eta_{K}^{2}= \sum_{\mathcal{E}_{K} \ni E \not \subset \partial \Omega_{i}} h_{E}\left(\left\|\left[\left(A \nabla_{h} u_{h}+\overline{\mathbf{f}}\right) \cdot \mathbf{n}\right]\right\|_{0, E}^{2}+\left\|\left[\nabla_{h} u_{h} \cdot \mathbf{s}\right]\right\|_{0, E}^{2}\right) \\
&+\sum_{\mathcal{E}_{K} \ni E \subset \Gamma_{D}} h_{E}\left\|\nabla_{h} u_{h} \cdot \mathbf{s}-\frac{\partial u_{D}}{\partial \mathbf{s}}\right\|_{0, E}^{2} \\
&+\sum_{\mathcal{E}_{K} \ni E \subset \Gamma_{N}} h_{E}\left\|A \nabla_{h} u_{h} \cdot \mathbf{n}-g\right\|_{0, E}^{2}  \tag{5.1}\\
&+\sum_{\mathcal{E}_{K} \ni E \subset \Gamma_{e}} h_{E}\left\|\frac{\partial u_{h}}{\partial \mathbf{n}}-\mathcal{B}_{N} u_{h}\right\|_{0, E}^{2},
\end{align*}
$$

where $\nabla_{h} u_{h} \in\left(L^{2}\left(\Omega_{i}\right)\right)^{2}$ is defined by $\left.\left(\nabla_{h} u_{h}\right)\right|_{K}:=\nabla\left(\left.u_{h}\right|_{K}\right), \mathbf{n}$ and $\mathbf{s}$ denote the unit normal and tangent vectors to the corresponding edges respectively, and where $\overline{\mathbf{f}}=\left(-f_{1},-f_{2}\right)^{T}$ with $f_{1}, f_{2}$ being given in (2.18). Suppose that $f \in H^{-1}(\Omega)$ satisfies a further assumption that $\partial_{1}\left(\left.f_{1}\right|_{K}\right), \partial_{2}\left(\left.f_{2}\right|_{K}\right) \in L^{2}(K)$, for all $K \in \mathcal{T}_{h}$, and $A \in\left(H^{1}(\Omega)\right)^{2 \times 2}$. Then, we have the following a posteriori error estimate.

Theorem 5.1. Let $u$ be the solution of problem (2.20), and $u_{h}$ be the solution of the finite element problem (4.2). Then, we have

$$
\left\|\nabla u-\nabla_{h} u_{h}\right\|_{0, \Omega_{i}} \leq C\left(\sum_{K \in \mathcal{T}_{h}}\left(h_{K}^{2}\left\|\mathcal{R}_{K}\left(u_{h}\right)\right\|_{0, K}^{2}+\eta_{K}^{2}\right)+\sum_{\mathcal{E} \ni E \subset \Gamma_{D}} h_{E}^{3} \int_{E}\left|\frac{\partial^{2} u_{D}}{\partial \mathbf{s}^{2}}\right|^{2} d s\right)^{\frac{1}{2}},
$$

where $\mathcal{R}_{K}\left(u_{h}\right):=\left.\left(\hat{f}+\operatorname{div}\left(A \nabla_{h} u_{h}\right)-c u_{h}\right)\right|_{K}$ with $\left.\hat{f}\right|_{K}=f_{0}-\partial_{1}\left(\left.f_{1}\right|_{K}\right)-\partial_{2}\left(\left.f_{2}\right|_{K}\right)$.
Proof. Let $p=\nabla u$, then $(p, u)$ is the solution of the mixed problem (3.1). Thus, it follows from theorem 4.2 that, for $p_{h}=\nabla_{h} u_{h}$ and $\tilde{u}_{h} \in V$ defined as (4.9),

$$
\begin{align*}
\left\|\nabla u-\nabla_{h} u_{h}\right\|_{0, \Omega_{i}} & \leq\left\|p-p_{h}\right\|_{0, \Omega_{i}}+\left\|u-\tilde{u}_{h}\right\|_{1, \Omega_{i}} \\
& \leq C\left(\left\|\operatorname{Res}_{L}\left(p_{h}, \tilde{u}_{h}\right)\right\|_{L^{*}}+\left\|\operatorname{Res}_{V}\left(p_{h}, \tilde{u}_{h}\right)\right\|_{V_{0}^{*}}\right) . \tag{5.2}
\end{align*}
$$

Notice that

$$
\begin{aligned}
\left\|\operatorname{Res}_{L}\left(p_{h}, \tilde{u}_{h}\right)\right\|_{L^{*}} & =\sup _{q \in L} \frac{\left|\alpha\left(p_{h}, q\right)-\beta\left(q, \tilde{u}_{h}\right)\right|}{\|q\|_{L}} \\
& \leq\left\|A \nabla_{h} u_{h}-A \nabla \tilde{u}_{h}\right\|_{0, \Omega_{i}} \leq C\left\|\nabla_{h} u_{h}-\nabla \tilde{u}_{h}\right\|_{0, \Omega_{i}},
\end{aligned}
$$

then by lemma 4.1, we have

$$
\begin{align*}
\left\|\operatorname{Res}_{L}\left(p_{h}, \tilde{u}_{h}\right)\right\|_{L^{*}} \leq & C\left(\sum_{\mathcal{E} \ni E \subset \Gamma_{D}}\left(h_{E}\left\|\nabla_{h} u_{h} \cdot \mathbf{s}-\frac{\partial u_{D}}{\partial \mathbf{s}}\right\|_{0, E}^{2}+h_{E}^{3}\left\|\frac{\partial^{2} u_{D}}{\partial \mathbf{s}^{2}}\right\|_{0, E}^{2}\right)\right. \\
& \left.+\sum_{\mathcal{E} \ni E \not \subset \partial \Omega_{i}} h_{E}\left\|\left[\nabla_{h} u_{h} \cdot \mathbf{s}\right]\right\|_{0, E}^{2}\right)^{\frac{1}{2}} . \tag{5.3}
\end{align*}
$$

Next, we consider

$$
\begin{equation*}
\left\|\operatorname{Res}_{V}\left(p_{h}, \tilde{u}_{h}\right)(v)\right\|_{V_{0}^{*}}=\sup _{v \in V_{0}} \frac{\left|-f(v)+\beta\left(p_{h}, v\right)+\gamma\left(\tilde{u}_{h}, v\right)\right|}{\|v\|_{1, \Omega_{i}}} \tag{5.4}
\end{equation*}
$$

Let $v_{h}$ be the Clément interpolation of $v$ in the conforming finite element space $\tilde{V}_{h, 0} \subset V_{h, 0}$. Noticing that $u_{h}$ is the finite element solution of (3.1), we have

$$
\begin{aligned}
& -f(v)+\beta\left(p_{h}, v\right)+\gamma\left(\tilde{u}_{h}, v\right) \\
= & -\sum_{K \in \mathcal{I}_{h}} \int_{K}\left(f_{0}\left(v-v_{h}\right)+f_{1} \partial_{1}\left(v-v_{h}\right)+f_{2} \partial_{2}\left(v-v_{h}\right)\right) d x \\
& -\int_{\Gamma_{N}} g\left(v-v_{h}\right) d s+\sum_{K \in \mathcal{T}_{h}} \int_{K} A \nabla_{h} u_{h} \cdot \nabla_{h}\left(v-v_{h}\right) d x \\
& +\int_{\Omega_{i}} c \tilde{u}_{h} v d x+b_{N}\left(\tilde{u}_{h}, v\right)-\int_{\Omega_{i}} c u_{h} v_{h} d x-b_{N}\left(u_{h}, v_{h}\right) \\
= & -\sum_{K \in \mathcal{T}_{h}} \int_{K}\left(\hat{f}+\operatorname{div}\left(A \nabla_{h} u_{h}\right)+c u_{h}\right)\left(v-v_{h}\right) d x
\end{aligned}
$$

$$
\begin{align*}
& +\int_{\Omega_{i}} c\left(\tilde{u}_{h}-u_{h}\right) v d x+\sum_{\mathcal{E} \ni E \not \subset \partial \Omega_{i}} \int_{E}\left[\left(A \nabla_{h} u_{h}+\overline{\mathbf{f}}\right) \cdot \mathbf{n}\right]\left(v-v_{h}\right) d s \\
& +\sum_{\mathcal{E} \ni E \subset \Gamma_{N}} \int_{E}\left(A \nabla_{h} u_{h} \cdot \mathbf{n}-g\right)\left(v-v_{h}\right) d s-\int_{\Gamma_{e}}\left(\mathcal{B}_{N} \tilde{u}_{h}-\mathcal{B}_{N} u_{h}\right) v d s \\
& +\sum_{\mathcal{E} \ni E \subset \Gamma_{e}} \int_{E}\left(\nabla u_{h} \cdot \mathbf{n}-\mathcal{B}_{N} u_{h}\right)\left(v-v_{h}\right) d s . \tag{5.5}
\end{align*}
$$

By the standard interpolation theory for Sobolev functions [6], we have

$$
\begin{align*}
& \left|\sum_{K \in \mathcal{T}_{h}} h_{K} \int_{K}\left(\hat{f}+\operatorname{div}\left(A \nabla_{h} u_{h}\right)+c u_{h}\right)\left(v-v_{h}\right) d x\right| \\
\leq & C\left(\sum_{K \in \mathcal{T}_{h}} h_{K}\left\|\hat{f}+\operatorname{div}\left(A \nabla_{h} u_{h}\right)+c u_{h}\right\|_{0, K}\|v\|_{1, \omega_{K}}\right) \\
\leq & C\left(\sum_{K \in \mathcal{T}_{h}} h_{K}^{2}\left\|\hat{f}+\operatorname{div}\left(A \nabla_{h} u_{h}\right)+c u_{h}\right\|_{0, K}^{2}\right)^{1 / 2}\|v\|_{1, \Omega_{i}}, \tag{5.6}
\end{align*}
$$

where $\omega_{K}=\bigcup_{\left\{K^{\prime} \in \mathcal{T}_{h}: K^{\prime} \cap K \neq \emptyset\right\}} K^{\prime}$,

$$
\begin{align*}
& \left|\sum_{\mathcal{E} \ni E \not \subset \partial \Omega_{i}} \int_{E}\left[\left(A \nabla_{h} u_{h}+\overline{\mathbf{f}}\right) \cdot \mathbf{n}\right]\left(v-v_{h}\right) d x\right| \\
\leq & C\left(\sum_{\mathcal{E} \ni E \not \subset \partial \Omega_{i}} h_{E}^{1 / 2}\left\|\left[\left(A \nabla_{h} u_{h}+\overline{\mathbf{f}}\right) \cdot \mathbf{n}\right]\right\|_{0, E}\|v\|_{1, \omega_{E}}\right) \\
\leq & C\left(\sum_{\mathcal{E} \ni E \not \subset \partial \Omega_{i}} h_{E}\left\|\left[\left(A \nabla_{h} u_{h}+\overline{\mathbf{f}}\right) \cdot \mathbf{n}\right]\right\|_{0, E}^{2}\right)^{1 / 2}\|v\|_{1, \Omega_{i}}, \tag{5.7}
\end{align*}
$$

where $\omega_{E}=\bigcup_{\left\{K \in \mathcal{T}_{h}: E \subset K\right\}} K$. Similarly, we have

$$
\begin{align*}
& \left|\sum_{\mathcal{E} \ni E \subset \Gamma_{N}} \int_{E}\left(A \nabla_{h} u_{h} \cdot \mathbf{n}-g\right)\left(v-v_{h}\right) d s\right| \\
\leq & C\left(\sum_{\mathcal{E} \ni E \subset \Gamma_{N}} h_{E}\left\|A \nabla_{h} u_{h} \cdot \mathbf{n}-g\right\|_{0, E}^{2}\right)^{1 / 2}\|v\|_{1, \Omega_{i}},  \tag{5.8}\\
& \left|\sum_{\mathcal{E} \ni E \subset \Gamma_{e}} \int_{E}\left(\nabla u_{h} \cdot \mathbf{n}-\mathcal{B}_{N} u_{h}\right)\left(v-v_{h}\right) d s\right|
\end{align*}
$$

$$
\begin{equation*}
\leq C\left(\sum_{\mathcal{E} \ni E \subset \Gamma_{e}} h_{E}\left\|\nabla u_{h} \cdot \mathbf{n}-\mathcal{B}_{N} u_{h}\right\|_{0, E}^{2}\right)^{1 / 2}\|v\|_{1, \Omega_{i}} \tag{5.9}
\end{equation*}
$$

It follows from lemma 4.1 that

$$
\begin{align*}
\left|\int_{\Omega_{i}} c\left(\tilde{u}_{h}-u_{h}\right) v d x\right| \leq & C\left\|\tilde{u}_{h}-u_{h}\right\|_{0, \Omega_{i}}\|v\|_{0, \Omega_{i}} \\
\leq & C\left(\sum_{\mathcal{E} \ni E \subset \Gamma_{D}}\left(h_{E}^{3}\left\|\nabla_{h} u_{h} \cdot \mathbf{s}-\frac{\partial u_{D}}{\partial \mathbf{s}}\right\|_{0, E}^{2}+h_{E}^{5}\left\|\frac{\partial^{2} u_{D}}{\partial \mathbf{s}^{2}}\right\|_{0, E}^{2}\right)\right. \\
& \left.+\sum_{\mathcal{E} \ni E \not \subset \partial \Omega_{i}} h_{E}^{3}\left\|\left[\nabla_{h} u_{h} \cdot \mathbf{s}\right]\right\|_{0, E}^{2}\right)^{\frac{1}{2}}\|v\|_{0, \Omega_{i}} . \tag{5.10}
\end{align*}
$$

By Parseval's relation for Fourier transformation, by lemma 4.1 and also by the trace theorem for Sobolev space, we have

$$
\begin{align*}
& \left|\int_{\Gamma_{e}}\left(\mathcal{B}_{N} \tilde{u}_{h}-\mathcal{B}_{N} u_{h}\right) v d s\right| \\
= & \left|\sum_{n=1}^{N} \frac{n}{\pi} \int_{0}^{2 \pi} \int_{0}^{2 \pi R}\left(\tilde{u}_{h}-u_{h}\right)(R, \theta) v(R, \varphi) \cos n(\theta-\varphi) d \theta d \varphi\right| \\
\leq & C\left(\int_{\Gamma_{e}}\left(\tilde{u}_{h}-u_{h}\right)^{2} d s\right)^{1 / 2}\left(\int_{\Gamma_{e}} v^{2} d s\right)^{1 / 2} \\
\leq & C\left(\sum_{\substack{E \cap \Gamma_{e} \neq \emptyset \\
\mathcal{E} \ni E \subset \Gamma_{e}}} h_{E}^{2}\left\|\left[\nabla_{h} u_{h} \cdot \mathbf{s}\right]\right\|_{0, E}^{2}\right)^{1 / 2}\|v\|_{1, \Omega_{i}} . \tag{5.11}
\end{align*}
$$

The proof of the theorem is completed by combining (5.2) with the inequalities (5.3)-(5.11).

Remark 5.1. Since the term $h_{K}^{2}\left\|\mathcal{R}_{K}\left(u_{h}\right)\right\|_{0, K}^{2}$ is in general a higher order term with respect to $\eta_{K}^{2}$, theorem 5.1 implies that $\eta_{K}$ is a reliable a posteriori error estimator.

For the efficiency of the a posteriori error estimator, we have the following result.

Theorem 5.2. Let $u$ be the solution of problem (2.20), $u_{h}$ be the solution of the finite element problem (4.2), and let the a posteriori error estimator $\eta_{K}$ be given
by (5.1). Then, for all $K \in \mathcal{T}_{h}$, we have

$$
\begin{align*}
\eta_{K} \leq & C\left(\left\|u-u_{h}\right\|_{1, \omega_{K}}+\sum_{\mathcal{E}_{K} \ni E \subset \Gamma_{N}} h_{E}^{1 / 2}\left\|g-g_{E}\right\|_{0, E}+h_{K}\left\|\hat{f}-\hat{f}_{K}\right\|_{0, \omega_{K}}\right. \\
& \left.+\sum_{\mathcal{E}_{K} \ni E \subset \Gamma_{e}} h_{E}^{1 / 2}\left\|\mathcal{B}_{N} u-\mathcal{B}_{N} u_{h}\right\|_{0, E}+\sum_{\mathcal{E}_{K} \ni E \subset \Gamma_{e}} h_{E}^{1 / 2}\left\|\frac{\partial u}{\partial \mathbf{n}}-\left(\frac{\partial u}{\partial \mathbf{n}}\right)_{E}\right\|_{0, E}\right), \tag{5.12}
\end{align*}
$$

where $g_{E}=\frac{1}{|E|} \int_{E} g d s, \hat{f}_{K}=\frac{1}{|K|} \int_{K} \hat{f}(x) d x$ and $\left(\frac{\partial u}{\partial \mathbf{n}}\right)_{E}=\frac{1}{|E|} \int_{E} \frac{\partial u}{\partial \mathbf{n}} d s$.
Proof. Except for the term $\sum_{\mathcal{E}_{K} \ni E \subset \Gamma_{e}} h_{E}^{1 / 2}\left\|\frac{\partial u_{h}}{\partial \mathbf{n}}-\mathcal{B}_{N} u_{h}\right\|_{0, E}$ in $\eta_{K}$, which, as is shown below, leads to the additional terms $\sum_{\mathcal{E}_{K} \ni E \subset \Gamma_{e}} h_{E}^{1 / 2}\left\|\mathcal{B}_{N} u-\mathcal{B}_{N} u_{h}\right\|_{0, E}+$ $\sum_{\mathcal{E}_{K} \ni E \subset \Gamma_{e}} h_{E}^{1 / 2}\left\|\frac{\partial u}{\partial \mathbf{n}}-\left(\frac{\partial u}{\partial \mathbf{n}}\right)_{E}\right\|_{0, E}$ on the right hand side of (5.12), the estimates for all of the other terms in $\eta_{K}$ are standard [4, 12]. As in [12], let $\hat{K}=\left\{\hat{x} \in R^{2}\right.$ : $\left.0 \leq \hat{x}_{1}, \hat{x}_{2}, \hat{x}_{1}+\hat{x}_{2} \leq 1\right\}$ be the reference finite element with $\hat{E}=\hat{K} \cap\left\{\hat{x}_{2}=0\right\}$, let $F_{K}: \hat{K} \rightarrow K \subset \omega_{E}$ be the one-one quadratic mapping with $F_{K}(\hat{E})=E \subset \Gamma_{e}$ (see section 4), and let $\hat{\mathcal{P}}: C(\hat{E}) \rightarrow C(\hat{K})$ be given by $\hat{\mathcal{P}}(\hat{v})(\hat{x})=\hat{v}\left(\hat{x}_{1}\right)$, we define an extension operator $\mathcal{P}: C(E) \rightarrow C\left(\omega_{E}\right)$ by $\left.(\mathcal{P} v)\right|_{K}:=\left(\hat{\mathcal{P}}\left(v \circ F_{K}\right)\right) \circ F_{K}^{-1}$. Denote $P_{h}=\mathcal{P}\left(\frac{\partial u_{h}}{\partial \mathbf{n}}-\left(\mathcal{B}_{N} u_{h}\right)_{E}\right)$, where $\left(\mathcal{B}_{N} u_{h}\right)_{E}=\frac{1}{|E|} \int_{E} \mathcal{B}_{N} u_{h} d s$, and let $b_{E}$ be the edge-bubble function defined on $\omega_{E}$ with respect to the edge $E$ [12]. Then, recall that $\mathcal{B}_{N} u=\frac{\partial u}{\partial \mathbf{n}}$, we have

$$
\begin{aligned}
& \left\|\frac{\partial u_{h}}{\partial \mathbf{n}}-\left(\mathcal{B}_{N} u_{h}\right)_{E}\right\|_{0, E}^{2} \leq C \int_{E} b_{E} P_{h}\left(\frac{\partial\left(u_{h}-u\right)}{\partial \mathbf{n}}+\mathcal{B}_{N} u-\left(\mathcal{B}_{N} u_{h}\right)_{E}\right) d s \\
= & C\left(\int_{K \supset E} \nabla\left(b_{E} P_{h}\right) \nabla\left(u_{h}-u\right) d x+\int_{E}\left(b_{E} P_{h}\right)\left(\mathcal{B}_{N} u-\left(\mathcal{B}_{N} u_{h}\right)_{E}\right) d s\right) \\
\leq & C\left(\left\|\nabla u-\nabla_{h} u_{h}\right\|_{0, K}\left\|\nabla\left(b_{E} P_{h}\right)\right\|_{0, K}+\left\|\mathcal{B}_{N} u-\left(\mathcal{B}_{N} u_{h}\right)_{E}\right\|_{0, E}\left\|b_{E} P_{h}\right\|_{0, E}\right) \\
\leq & C\left(h_{E}^{-1}\left\|\nabla u-\nabla_{h} u_{h}\right\|_{0, K}\left\|b_{E} P_{h}\right\|_{0, K}+\left\|\mathcal{B}_{N} u-\left(\mathcal{B}_{N} u_{h}\right)_{E}\right\|_{0, E}\left\|b_{E} P_{h}\right\|_{0, E}\right) \\
\leq & C\left(h_{E}^{-1 / 2}\left\|\nabla u-\nabla_{h} u_{h}\right\|_{0, K}+\left\|\mathcal{B}_{N} u-\left(\mathcal{B}_{N} u_{h}\right)_{E}\right\|_{0, E}\right)\left\|\frac{\partial u_{h}}{\partial \mathbf{n}}-\left(\mathcal{B}_{N} u_{h}\right)_{E}\right\|_{0, E} .
\end{aligned}
$$

This gives

$$
h_{E}^{1 / 2}\left\|\frac{\partial u_{h}}{\partial \mathbf{n}}-\mathcal{B}_{N} u_{h}\right\|_{0, E}
$$

$$
\begin{align*}
& \leq h_{E}^{1 / 2}\left(\left\|\frac{\partial u_{h}}{\partial \mathbf{n}}-\left(\mathcal{B}_{N} u_{h}\right)_{E}\right\|_{0, E}+\left\|\mathcal{B}_{N} u_{h}-\left(\mathcal{B}_{N} u_{h}\right)_{E}\right\|_{0, E}\right) \\
& \leq\left\|\nabla u-\nabla_{h} u_{h}\right\|_{0, K}+h_{E}^{1 / 2}\left(\left\|\mathcal{B}_{N} u-\left(\mathcal{B}_{N} u_{h}\right)_{E}\right\|_{0, E}+\left\|\mathcal{B}_{N} u_{h}-\left(\mathcal{B}_{N} u_{h}\right)_{E}\right\|_{0, E}\right) \\
& \leq\left\|\nabla u-\nabla_{h} u_{h}\right\|_{0, K}+h_{E}^{1 / 2}\left(\left\|\mathcal{B}_{N} u-\mathcal{B}_{N} u_{h}\right\|_{0, E}+2\left\|\mathcal{B}_{N} u_{h}-\left(\mathcal{B}_{N} u_{h}\right)_{E}\right\|_{0, E}\right) . \tag{5.13}
\end{align*}
$$

Since $\frac{\partial u}{\partial \mathbf{n}}=\mathcal{B}_{N} u$ and $\left\|\left(\mathcal{B}_{N} u\right)_{E}-\left(\mathcal{B}_{N} u_{h}\right)_{E}\right\|_{0, E} \leq\left\|\mathcal{B}_{N} u-\mathcal{B}_{N} u_{h}\right\|_{0, E}$, we have

$$
\begin{align*}
\left\|\mathcal{B}_{N} u_{h}-\left(\mathcal{B}_{N} u_{h}\right)_{E}\right\|_{0, E} \leq & \left\|\mathcal{B}_{N} u-\mathcal{B}_{N} u_{h}\right\|_{0, E}+\left\|\left(\mathcal{B}_{N} u\right)_{E}-\left(\mathcal{B}_{N} u_{h}\right)_{E}\right\|_{0, E} \\
& +\left\|\mathcal{B}_{N} u-\left(\mathcal{B}_{N} u\right)_{E}\right\|_{0, E} \\
\leq & 2\left\|\mathcal{B}_{N} u-\mathcal{B}_{N} u_{h}\right\|_{0, E}+\left\|\frac{\partial u}{\partial \mathbf{n}}-\left(\frac{\partial u}{\partial \mathbf{n}}\right)_{E}\right\|_{0, E} .(5 . \tag{5.14}
\end{align*}
$$

The proof is completed by combining (5.13) and (5.14).
Remark 5.2. If $\partial K \cap \Gamma_{e}=\emptyset$, the right hand side of (5.12) reduces to

$$
C\left(\left\|u-u_{h}\right\|_{1, \omega_{K}}+h_{K}\left\|\hat{f}-\hat{f}_{K}\right\|_{0, \omega_{K}}+\sum_{\mathcal{E}_{K} \ni E \subset \Gamma_{N}} h_{E}^{1 / 2}\left\|g-g_{E}\right\|_{0, E}\right) .
$$

This implies that, for the elements not lying on the artificial boundary $\Gamma_{e}$, our estimator is efficient.

Remark 5.3. On the artificial boundary $\Gamma_{e}$, we have

$$
\begin{align*}
& \sum_{\mathcal{E}_{K} \ni E \subset \Gamma_{e}} h_{E}^{1 / 2}\left\|\frac{\partial u}{\partial \mathbf{n}}-\left(\frac{\partial u}{\partial \mathbf{n}}\right)_{E}\right\|_{0, E} \leq C \sum_{\mathcal{E}_{K} \ni E \subset \Gamma_{e}} h_{E}^{\frac{3}{2}}\left\|\frac{\partial^{2} u}{\partial \mathbf{s} \partial \mathbf{n}}\right\|_{0, E} \\
\leq & C \sum_{\mathcal{E}_{K} \ni E \subset \Gamma_{e}} h_{E}^{2}|u|_{2, \infty, K}, \tag{5.15}
\end{align*}
$$

that is of the same order as the term $\left\|u-u_{h}\right\|_{1, \omega_{K}} \leq C h_{K}^{2}|u|_{2, \infty, K}$. Furthermore, $\sum_{\mathcal{E}_{K} \ni E \subset \Gamma_{e}} h_{E}^{1 / 2}\left\|\frac{\partial u}{\partial \mathbf{n}}-\left(\frac{\partial u}{\partial \mathbf{n}}\right)_{E}\right\|_{0, E}$ could be replaced by a higher term under the assumption of better regularity of $u$ near $\Gamma_{e}$, which is true in most cases. On the term $\sum_{\mathcal{E}_{K} \ni E \subset \Gamma_{e}} h_{E}^{1 / 2}\left\|\mathcal{B}_{N} u-\mathcal{B}_{N} u_{h}\right\|_{0, E}$, noticing that

$$
\left|\sum_{n=1}^{N} n \int_{0}^{2 \pi}\left(u-u_{h}\right) \cos n(\theta-\phi) d \theta\right| \leq \sqrt{2 \pi} N^{2} R^{-1}\left(\int_{\Gamma_{e}}\left(u-u_{h}\right)^{2} d s\right)^{1 / 2}
$$

we have

$$
\begin{align*}
& \sum_{\mathcal{E}_{K} \ni E \subset \Gamma_{e}} h_{E}^{1 / 2}\left\|\mathcal{B}_{N} u-\mathcal{B}_{N} u_{h}\right\|_{0, E} \leq C N^{2} h_{E}\left(\int_{\Gamma_{e}}\left(u-u_{h}\right)^{2} d s\right)^{1 / 2} \\
\leq & C N^{2} h_{E}^{3 / 2} \sum_{K^{\prime} \cap \Gamma_{e} \neq \emptyset}\left\|u-u_{h}\right\|_{1, K^{\prime}} \leq C N^{2} h_{E}^{3 / 2} \sum_{K^{\prime} \cap \Gamma_{e} \neq \emptyset} h_{K^{\prime}}^{2}|u|_{2, \infty, K^{\prime}} . \tag{5.16}
\end{align*}
$$

When $\partial K \cap \Gamma_{e} \neq \emptyset$, the right hand side of (5.16) is of order $O\left(h_{E}^{2}\right)$, that is of the same order as the term $\left\|u-u_{h}\right\|_{1, \omega_{K}} \leq C h_{K}^{2}|u|_{2, \infty, K}$, if $\max _{E \subset \Gamma_{e}}\left\{h_{E}\right\} \leq$ $\left(\min _{E \subset \Gamma_{e}}\left\{h_{E}\right\}\right)^{1 / 2}$. So, as long as the condition $\max _{E \subset \Gamma_{e}}\left\{h_{E}\right\} \leq\left(\min _{E \subset \Gamma_{e}}\left\{h_{E}\right\}\right)^{1 / 2}$ is satisfied, our a posteriori error estimator is also efficient on the artificial boundary. In fact, the condition is easily satisfied if the solution $u$ is sufficiently smooth near the artificial boundary, which is always the case for our problem if $R$ is sufficiently large, and the violation of the condition implies that the solution has certain singularity on the artificial boundary. In the later case, we should choose a larger circle as a new artificial boundary.

## 6. An Adaptive Algorithm and Numerical Examples

In this section, we apply a standard mesh adaptive algorithm with $\eta_{K}$ defined by (5.1) as the a posteriori error estimator, to some typical numerical examples. In addition, it is well-known that the recovery technique could give much efficient a posteriori error estimators in many numerical examples. Thus, we would also like to make some numerical comparisons between our error estimator and some recovery type error estimators in our numerical experiments.

## Algorithm:

(1) Given an initial mesh $\mathcal{T}_{0}$, a tolerance $T O L>0$, and a number $0<\mu<1$.
(2) Solve the problem on the mesh $\mathcal{T}_{i}$, to obtain the solution $u_{h}$.
(3) Calculate the error estimator $\eta_{K}$ on each element $K$, and set $\eta_{\max }=$ $\max _{K \in \mathcal{T}} \eta_{K}$. If $\left(\sum_{K \in \mathcal{T}} \eta_{K}^{2}\right)^{1 / 2}<T O L$, stop, else go to the next step.
(4) If $\eta_{K}>\mu \eta_{\text {max }}$, mark it. Generate a new mesh by regularly refining the marked elements, that is to divide triangles into four by joining the midpoints of edges.
(5) Refine further the other elements (red-green-blue refinement, page 108 in [12]) to eliminate the hanging nodes. Go back to (2).

Example 1. An exterior problem for the Poisson equation.
We consider the following problem defined on $\Omega=\{(r, \theta): r>0.5,0 \leq \theta \leq$ $2 \pi\}$, a planar domain outside a circular obstacle of radius $r_{0}=0.5$.

$$
\begin{align*}
-\Delta u & =0, & & \text { in } \Omega,  \tag{6.1}\\
u(0.5, \theta) & =0.5 \ln \frac{0.4525+0.45 \sin \theta}{0.4525-0.45 \sin \theta}, & & 0 \leq \theta \leq 2 \pi  \tag{6.2}\\
u & \rightarrow 0, & & r \rightarrow \infty \tag{6.3}
\end{align*}
$$

The problem has an exact solution:

$$
\begin{equation*}
u(r, \theta)=0.5 \ln \frac{r^{2}+0.9 r \sin \theta+0.45^{2}}{r^{2}-0.9 r \sin \theta+0.45^{2}} \tag{6.4}
\end{equation*}
$$

The numerical results of corresponding finite element problem (4.2) with $N=9$ are shown in Table 1 and Figure 2, where $N_{K}$ is the number of elements in a mesh, err $=\frac{\left\|\nabla u-\nabla_{h} u_{h}\right\|_{0}, \Omega_{i}}{\|\nabla u\|_{0, \Omega_{i}}}$ is the relative error of the numerical solution in $H^{1}\left(\Omega_{i}\right)$ semi-norm for $R=2$, and est is the corresponding error estimate given by our a posteriori error estimator which is also divided by $\|\nabla u\|_{0, \Omega_{i}}$. It is

Table 1. Numerical results for example 1 using estimator $\eta$.

| $N_{K}$ | Error err | Estimator est | err/est |
| ---: | :---: | :---: | :---: |
| 547 | 0.224978 | 1.044764 | 0.21534 |
| 951 | 0.155840 | 0.761614 | 0.20462 |
| 1419 | 0.122980 | 0.620880 | 0.19807 |
| 2659 | 0.089849 | 0.469365 | 0.19143 |
| 5301 | 0.064120 | 0.340269 | 0.18844 |
| 7368 | 0.055490 | 0.294950 | 0.18813 |
| 10567 | 0.046520 | 0.249202 | 0.18668 |
| 15484 | 0.038554 | 0.207170 | 0.18610 |

clearly shown in Table 1 that the ratios of the estimates and the errors converge to a constant during the process of adaptivity, which verifies that our posteriori estimator is both reliable and efficient, and suggests further that, the estimator, multiplied by a constant factor is asymptotically exact in this situation. Compare the convergence behavior of the errors and estimates of the numerical solutions on both the uniformly refined and adaptively refined meshes shown in Figure 4, we see that the adaptive method produces much sharper numerical results and reaches the optimal convergence order $O\left(N_{K}^{-1 / 2}\right)$.

Figure 4. Convergence behavior for Example 1.

To compare our a posteriori error estimator with some recovery type error estimators, we also compute the problem by using the average type error estimator $\tilde{\eta}_{K}=\left\|\nabla u_{h}-G_{h} \nabla u_{h}\right\|_{0, K}([15])$, where $\left.G_{h} \nabla u_{h}\right|_{K} \in\left(P^{1}(K)\right)^{2}$ with

$$
G_{h} \nabla u_{h}\left(a_{i}\right)=\left.\sum_{K^{\prime} \in \omega_{a_{i}}} \frac{\left|K^{\prime}\right|}{\left|\omega_{a_{i}}\right|} \nabla u_{h}\right|_{K^{\prime}}\left(a_{i}\right),
$$

for any node $a_{i}$ of $K$. Table 2 is the corresponding numerical results where err has the same meaning as before and $e s t_{A}$ is the corresponding estimate given by the estimator $\tilde{\eta}$, which is also divided by $\|\nabla u\|_{0, \Omega_{i}}$. It shows that the two estimators could generate almost the same accuracy on the meshes with similar numbers of freedoms while the ratio err/est $A_{A}$ is close to 1 .

Table 2. Numerical results for example 1 using estimator $\tilde{\eta}$.

| $N_{K}$ | Error err | Estimator est $_{A}$ | err $/$ est $_{A}$ |
| ---: | :---: | :---: | :---: |
| 517 | 0.240136 | 0.224495 | 1.06967 |
| 869 | 0.163397 | 0.157478 | 1.03759 |

| 10960 | 0.045165 | 0.043993 | 1.02664 |
| 13638 | 0.040550 | 0.039534 | 1.02569 |

Example 2. The potential of the stray field energy in micromagnetics.
In micromagnetic simulations, one difficulty is the non-locality of the stray field. For a ferromagnetic material occupying a bounded domain $\Omega_{m} \subset \mathbf{R}^{d}$, the potential of the stray field energy $u$ is determined by the magnetization field $\mathbf{m}$ through the following Maxwell's equation:

$$
\begin{align*}
\operatorname{div}\left(-\nabla u+\mathbf{m} \chi_{\Omega_{m}}\right) & =0, & & \text { in } \mathbf{R}^{d},  \tag{6.5}\\
u & \rightarrow 0, & & \text { as }|x| \rightarrow \infty . \tag{6.6}
\end{align*}
$$

We notice here that equation (6.5) is considered to hold in $H^{-1}\left(\mathbf{R}^{d}\right)$, and thus, in 2-dimensions, the problem is equivalent to problem (2.1)-(2.4) with $\Omega=\mathbf{R}^{2}$, $\Gamma=\Gamma_{N} \bigcup \Gamma_{D}=\emptyset$, and $f$ being such that $f_{0}=0,-\overline{\mathbf{f}}=\left(f_{1}, f_{2}\right)^{T}=\mathbf{m} \chi_{\Omega_{m}}$ (see (2.14)), where $\chi_{\Omega_{m}}$ is the characteristic function of $\Omega_{m}$.

Figure 5. The convergence behavior for Example 2.
In our numerical experiments, we take $\Omega_{m}=[-0.1,0.1] \times[-0.5,0.5]$ and $\Omega_{i}=B(0,1)$, and set $\mathbf{m}=(\cos (20 \pi x y), \sin (20 \pi x y))^{T}$, which are unit vectors in $\mathbf{R}^{2}$, moreover, we set $N=9$. We see in Figure 5, which shows the a posteriori error estimates for the numerical solutions on both the uniformly and adaptively refined meshes, that the expected optimal convergence rate $O\left(N_{K}^{-1 / 2}\right)$ is obtained by the adaptive method. In Figure 6, we show the initial mesh and some selected adaptively refined meshes, and it is clearly seen that the area where $u$ has

Figure 6. the mesh for Example 2.
significantly larger variance of derivatives are refined once and again during the adaptivity process.
